

Antivirus

For ease of administration, the optimal performance settings of the antivirus module and antivirus filtering settings are pre-configured in the product and do not require manual configuration. If necessary, the settings are optimized in SafeUTM version updates.

To check HTTPS traffic, you need to enable decoding in the [Content filter](#).

Database update 16 minutes ago

The antivirus module is connected to a proxy server and a content filter, so it filters web traffic when the following conditions are met:

- The web resource is not in the proxy server's exclusion lists for its intended purpose.
- The user to whom the traffic is incoming is not included in the proxy server exceptions by source.
- The HTTPS site is checked only if the HTTPS traffic is decrypted by a content filter.

Checking Antivirus Work

You can try downloading test files from the site: https://www.eicar.org/?page_id=3950.

If configured correctly, the browser will display an access error.
