Mail Relay

This section provides instructions for configuring the mail service, as well as for using additional features, such as webmail, spam checking, mail relay, forwarding, etc.

> All mail traffic filtering capabilities can also be applied to an internal mail server by publishing it via a mail relay.

To configure the mail server in the SafeUTM web interface, go to the **Mail relay** menu**.** This section contains all the key parameters that affect mail service work. All configurable parameters are divided into several categories. Each section of the mail server is described below.

> If you use the SafeUTM mail server as a full-fledged server with mail storage, it is mandatory to store mail on an additional HDD/SSD drive. Connect an additional hard drive to the server before using mail.

> When configuring the **cluster**, mail will be available for operation only in the mail relay mode. Mailbox storage is disabled.
