

Creating the config.plist file for SafeDNS Endpoint Lite on macOS

Use this guide to create the **Config.plist** file on target macOS devices before deploying SafeDNS Endpoint Lite.

1. Add the AuthKey to the script

Open [create-conf.sh](#) and replace

"123zZGNI0GYtN2Nokd00M2ZILWAKD2UtNTU000NINjc5Maaa" (line 9) with your **Base64-encoded AuthKey**.

```
LOG_FILE="/var/log/safedns-installer.log"
```

```
AUTH_KEY="123zZGNl0GYtN2Nokd00M2ZILWAKD2UtNTU000NINjc5Maaa" – the part to modify
```

```
DEVICE_NAME=$(scutil --get ComputerName 2>/dev/null || hostname)
```

It won't work with the sample key from the original script

2. Upload the script to SimpleMDM

1. Go to **Scripts**

- Devices**
 - Devices
 - Groups
 - Enrollments
 - Locations
- Apps & Media**
 - Catalog
 - VPP
 - Munki
- Configs**
 - Profiles
 - Providers
 - Attributes
- Scripts**
 - Scripts
 - Jobs
- Account**

2. Click on **Create Script**

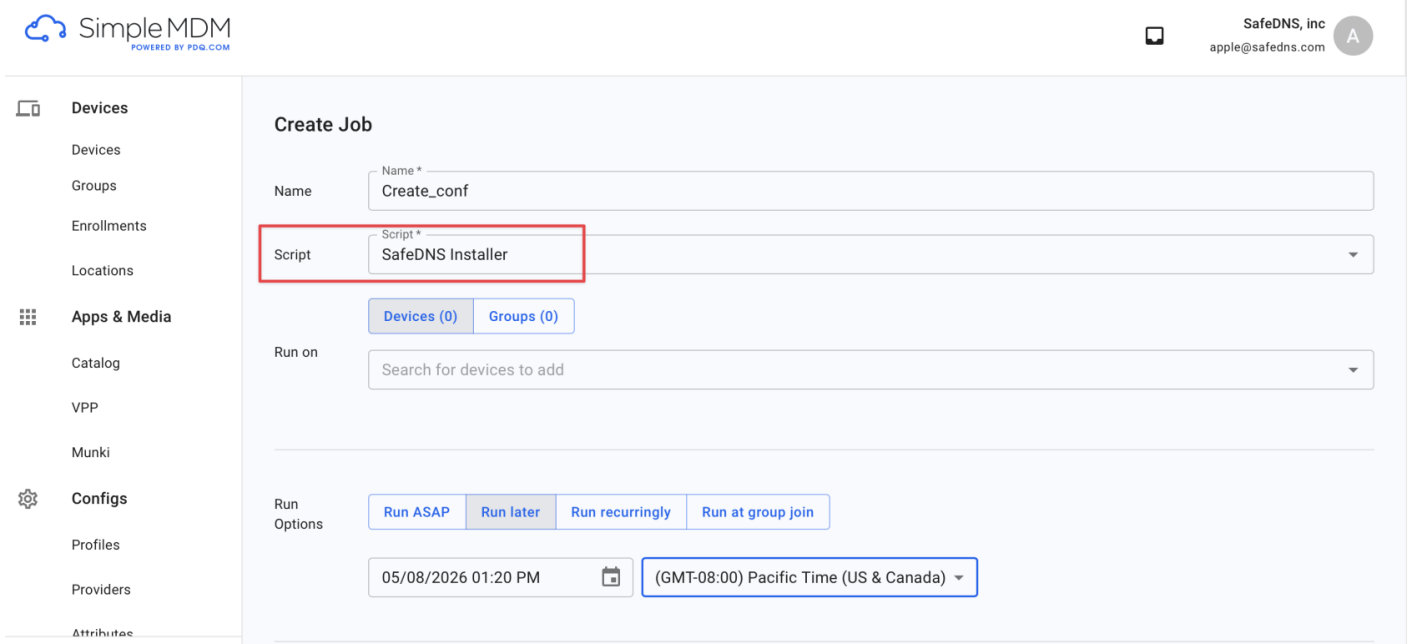

Navigation bar showing **Scripts** selected. A **Create Script** button is highlighted with a red box.

3. Give it a name, for example **SafeDNS_Installer**, upload the updated **create-conf.sh**, and click **Save**.

3. Run the script on target devices

1. Go to **Jobs > Create Job**.

The screenshot shows the 'Create Job' form in the SimpleMDM interface. The 'Script' dropdown menu is highlighted with a red box, indicating the selection of 'SafeDNS Installer'. The form includes fields for 'Name' (Create_conf), 'Run on' (Search for devices to add), and 'Run Options' (Run ASAP, Run later, Run recurringly, Run at group join). The date and time are set to 05/08/2026 01:20 PM in Pacific Time (US & Canada).

2. Select the script you created with your AuthKey, choose the target devices or device groups, configure the run option, and run the job.

4. Verify the result

After the job runs, check that the following files were created on the target Mac:

- **Config.plist**
- **/var/log/safedns-installer.log**

The log file confirms that the script was delivered and executed.
