

SafeDNS Application deployment using MDM Integrators for iOS

General guide

1. Obtain a personal **AuthKey** from SafeDNS support in your Personal Account in the form of a String (Base64 encoding is handled on our side). Example format:
MGNjYnYyYWltMTQxNy00MjVlqTkzNjEtMDMzY2I2MTU4YzVi.
2. Install the SafeDNS application in the **MDM Integrator's** Personal Account by adding it through Apple Store App in the Apps catalog.
3. Wait for the application to be deployed on the devices.
4. Once the initial setup is complete and the device is registered in the SafeDNS Dashboard, create a Custom Configuration Profile in the Integrator's menu. This profile should include our DNSProxy.mobileconfig with the AppBundleIdentifier and the AuthKey: com.safedns.agent and ProviderBundleIdentifier: com.safedns.agent.dnsProxy. Then, this profile is deployed to the devices. After the profile is installed, a new DNS Proxy Server section will appear in the smartphone's settings with SafeDNS parameters, initiating the traffic interception, redirection, and filtering module.

The filtering process may take 3-5 minutes to start.

SimpleMDM example

1. Create an account on <https://simplemdm.com> and add your Apple id.
2. Obtain a personal **authKey** from SafeDNS support in your Personal Account in the form of a String (Base64 encoding is handled on our side). Example format:
MGNjYnYyYWltMTQxNy00MjVlqTkzNjEtMDMzY2I2MTU4YzVi.

3. Now the application can be deployed on the devices.

If your devices are already enrolled the deployment will be done automatically.

If not you first need to enroll them in SimpleMDM: Go to Devices > Enrollments > Add Enrollment.

Enrollments

Enrollments Settings

Enrollments provide a means of adding devices to your SimpleMDM account. Enrollment codes can be a link your users visit from their devices. They can also link your account to Automated Enrollment within Apple Business Manager.

- Group Enrollment
- One-Time Enrollment

After a successful installation, the application **does not need to be launched** on end devices.

4. After the application is installed on the devices, complete the full configuration of the app by adding the **profile** with the **authKey**.

Once the initial setup is complete and the device is registered in the SafeDNS Dashboard, create a Custom Configuration Profile in the Integrator's Personal Account. Upload the custom DNSProxy.mobileconfig profile (received from SafeDNS).

This profile includes DNS-Proxy details showed below where you need to change **one line** by adding the AuthKey:

```
<key>AuthKeyBase64</key>
```

```
<string>!!! Enter here your AuthKey</string>
```

"!!!! Enter here your **AuthKEY**" – needs to be replaced with the **AuthKey** received from SafeDNS support

* Name	TestSafeDNSProfile

Please find below the link to the file: [SafeDNS-Proxy.mobileconfig](#)

Depending on the connection speed and profile propagation on the devices, a DNS-Proxy section with our settings will be added to the Device Management and VPN menu in the device settings. After this, the application and filtering module will synchronize, and filtering will begin based on the configuration settings in the SafeDNS.com Personal Account.

The filtering process may take 3-5 minutes to start.
