

Top-level Domains Blocking

If you want to block any top-level domain, just add it without a leading dot to your **Denylist**.

For example, if you want to block access to all websites in the RU domain zone, add **ru** to your Denylist.

The screenshot shows a web interface for managing a Denylist. On the left is a sidebar with a 'Categories' dropdown menu containing 'Allowlist' and 'Denylist' (which is selected). Below the categories are links for 'Stats', 'Help', and 'Account'. The main content area has a header with a 'Search domain' input, a 'List name' input, and buttons for 'Create list' and 'Add from existed'. Below this is a section titled 'Deny list' with a '4/400' indicator. It contains an 'Enter a hostname' input, a 'Comment' input, and 'Add' and 'Edit as list' buttons. A table below shows a list of domains: 'cn', 'ru', '中国', and 'рф'. Each domain has a trash icon to its right.

Internationalized country code top-level domains should be added to the Denylist list in the IDN form:

(Chinese IDN ccTLD), **中国** (Russian IDN ccTLD), etc.

A full list of top-level domains can be found on the [IANA website](#) and [Wikipedia](#).

Please note that settings take 5-7 minutes to apply.
Stats and filtering status update every 10 minutes.
