# Windows 11 DNS Setup

Step-by-step guide

1. From the Taskbar panel, **right-click** on the Wi-Fi (or LAN) icon and select **Network and Internet settings**:

2. Select **Advanced network settings**.

3. Scroll down and select **More network adapter options**
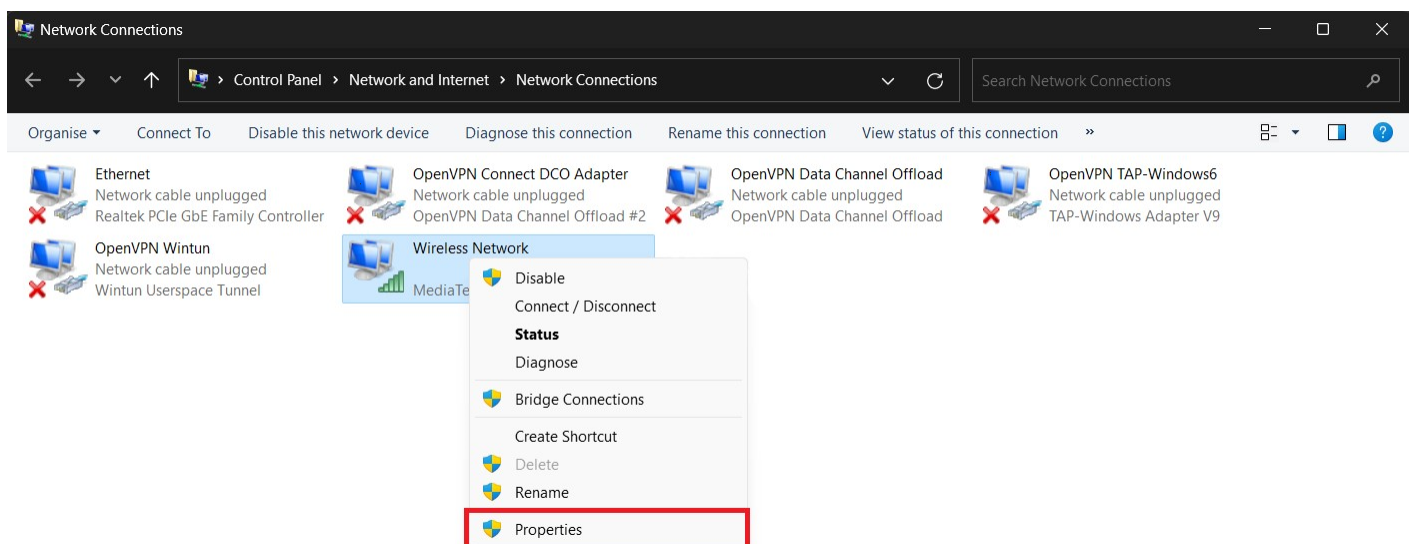

4. **Right-click** on the current internet connection, and select **Properties**. If the system shows the security notification, click Yes.

5. We recommend disabling **Internet Protocol Version 6**. This will simplify the installation process and will have no effect on the quality of your internet connection. After that, select **Internet Protocol Version 4**, and click on **Properties.**
Image not found or type unknown

5. Select the option **Use the following DNS server addresses**, and enter the following SafeDNS addresses:

Preferred DNS server: 195.46.39.39
**Alternate DNS server: 195.46.39.40**

Image not found or type unknown

6. Click the **OK** button to save your settings, and **Close** the network properties window.

7. Navigate to the SafeDNS **Dashboard > Settings** and copy your IP address in the "**Enter an IP-address or DynDNS**" box. Click "**Add**".
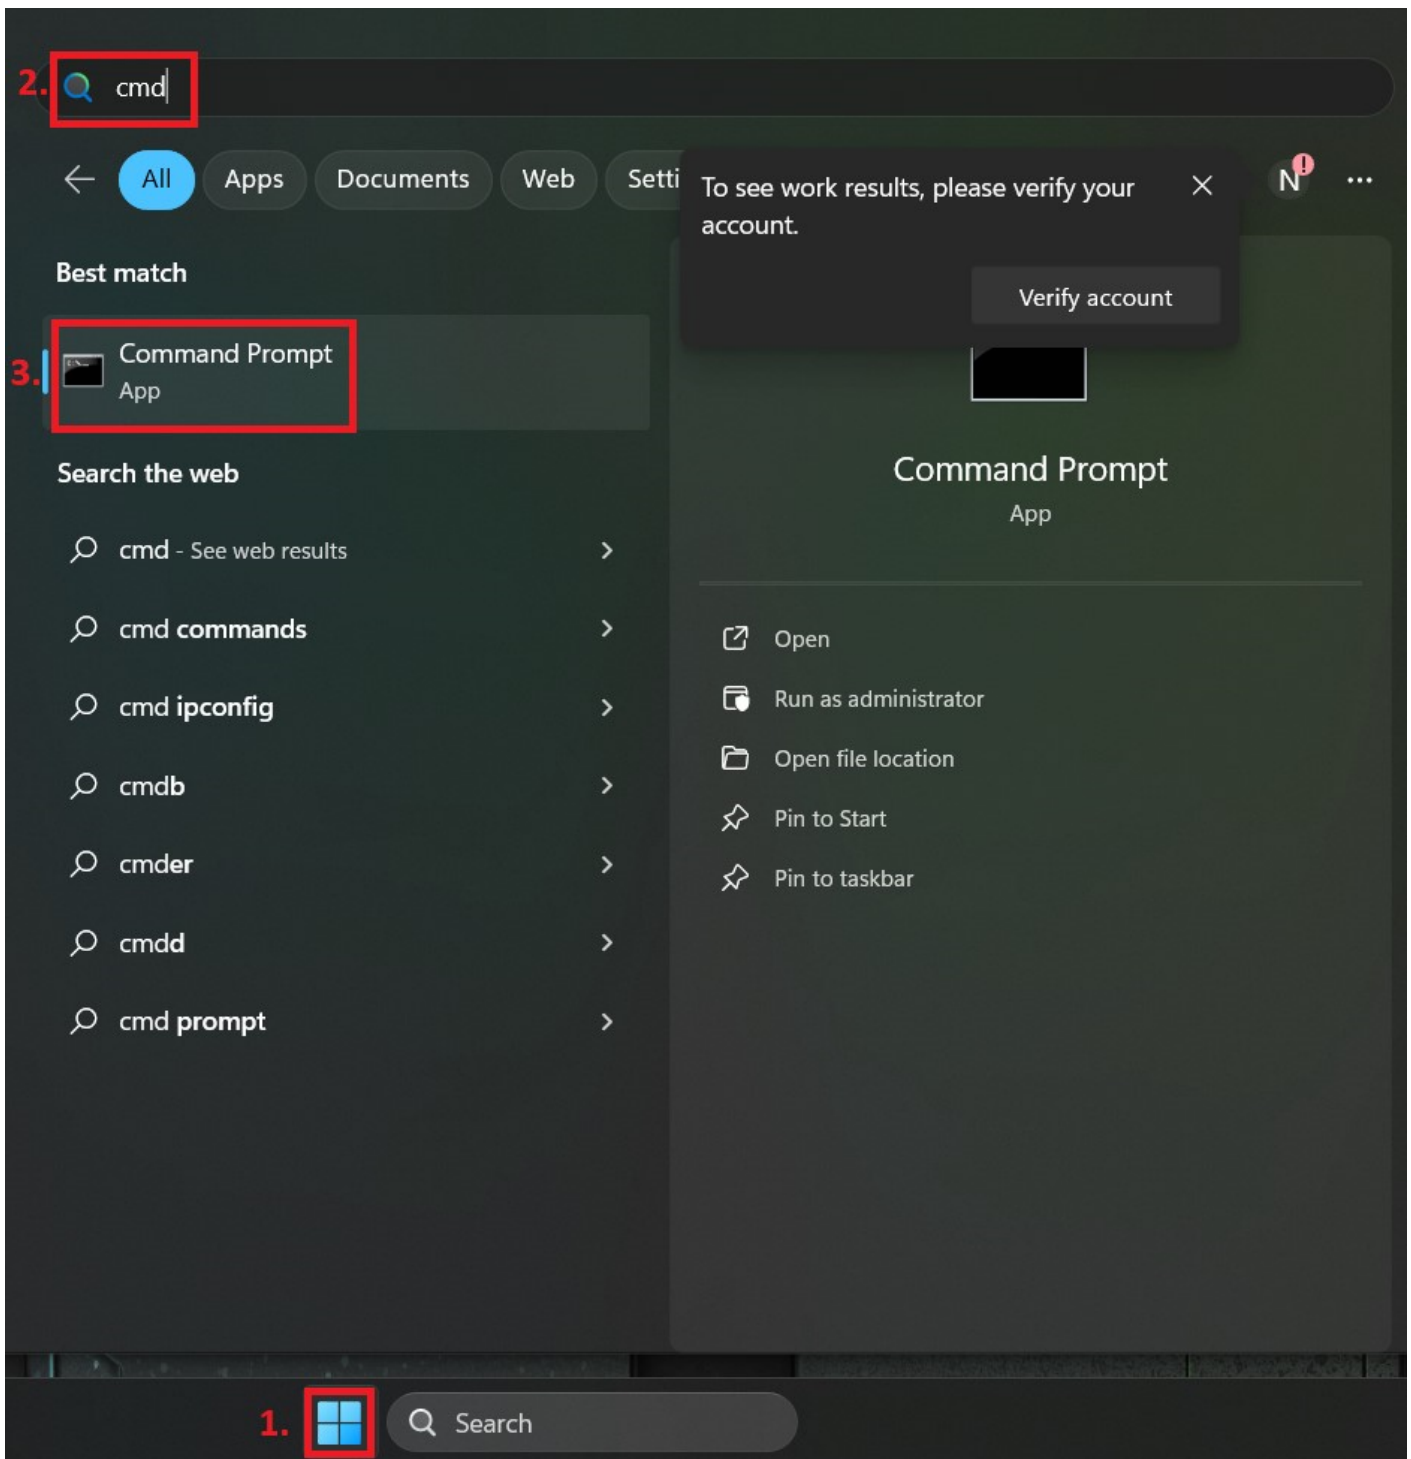

You have successfully configured the SafeDNS for Windows 11.

Troubleshooting

Please note that Windows may still be using the addresses saved in the local DNS cache. It is recommended to clean it using the following steps:

1. Press "**Start**"

2. Search for "**cmd**" and open the suggested application

3. Enter and run the following command in the opened window **ipconfig /flushdns**

[Learn more about how to clear DNS cache.](#)

Please note that settings take 5-7 minutes to apply.
Stats and filtering status update every 10 minutes.
